

Dhruv Jain

Full-Stack Software Developer & Team Lead | C# / .NET · TypeScript · SQL Server

Ahmedabad, India (IST / UTC+5:30) | Open to remote | +91 7016581281

it.dhruvjain@gmail.com | linkedin.com/in/connect-dhruvjain

SUMMARY

Full-stack developer with 4+ years building enterprise web platforms on C# / .NET and TypeScript single-page front ends, now Team Lead across two concurrent products while still shipping code daily. Known for taking on the problems others route around: rebuilt the calculation pipeline of a ten-year-old product that successive leads had avoided, cutting report generation from 5–10 minutes to 5–10 seconds. Designs from how the product will actually be used — edge cases, future cases, and the UX consequences of a schema decision. Leads the company's AI-assisted development practice, with MCP integrations shipped into three client products and a year of daily agentic development.

TECHNICAL SKILLS

Languages: C#, TypeScript, JavaScript, SQL (T-SQL), Python

Backend: .NET 10 / .NET 8 / .NET Core, RESTful API design, third-party API integrations, Clean Architecture and DDD, modular-monolith design, Redis caching

Databases: Microsoft SQL Server, T-SQL, stored-procedure analysis and optimisation, relational schema design, query performance tuning

Frontend: Angular (20 / 15 / 12), TypeScript, HTML5, CSS3, component-driven SPA architecture, config-driven reusable UI layers, UX-led feature design

Cloud and DevOps: Microsoft Azure, Azure AD B2C, Azure DevOps CI/CD, Git, TFS, branching and pull-request workflows

AI Engineering: Model Context Protocol (MCP) — three client integrations shipped, company training lead; agentic coding workflows (Claude), 1+ year daily use; AI prompting; Google Gemini API; static analysis for agent context

Quality and Tooling: SonarQube, ESLint, code review and quality gates, agile ceremonies, collaborative estimation

Currently learning: Vue 3, PostgreSQL

EXPERIENCE

iFour Technolab Pvt. Ltd. — Ahmedabad, India | February 2022 – Present

Approximately 100-person software services company building custom web and enterprise applications for international clients.

Team Lead | August 2025 – Present

- Lead a cross-functional team across two concurrent products while remaining hands-on — architecture, code review and feature delivery from requirement through release.
- Break product-owner requirements into scoped, estimable development tickets; run daily stand-ups, kick-offs, collaborative estimation and retrospectives.
- Define and codify engineering standards — layered backend boundaries, a config-driven reusable front-end layer, ESLint and SonarQube quality gates — and mentor developers on them.
- Own the branching and pull-request workflow on Azure DevOps CI/CD and make cross-module technical decisions.
- Lead company-wide training on Model Context Protocol (MCP) and AI prompting, upskilling engineers across teams on agentic development practices.
- Delivered MCP integrations into three separate client products as a shipped, client-facing capability, and apply agentic coding workflows daily — holding AI-generated code to the same review discipline and quality gates as hand-written work.
- Own client relationships directly for the products I lead; recognised with the company's Client Excellence Award (2025) for delivery quality on PIQET.

Software Engineer | August 2023 – July 2025

- Delivered calculation-heavy features on PIQET, including Excel import/export and robust PDF report generation over complex life-cycle-assessment computations.
- Integrated the Google Gemini API into Bistly for automated survey generation and AI-driven response analysis — an early production use of LLMs in a client product.
- Recognised with the company's Rising Star Award (August 2024).

Junior Software Engineer | August 2022 – July 2023

- Built full-stack Angular and .NET features on live client products, including inventory and packaging module enhancements for New Horizon ERP.

- Took assigned modules from specification through implementation, testing and release under senior review.

Software Engineer Intern | February 2022 – July 2022

- Built .NET and SQL Server features on live client projects, converting to a full-time engineering role on completion.

KEY PROJECTS

PIQET — Packaging Life Cycle Assessment (LCA) Platform | Team Lead, current

Angular 15 · .NET Core 6 · SQL Server · Redis

Assesses the environmental impact and resource use of packaging options.

- Cut report generation from 5–10 minutes to 5–10 seconds — roughly 60x — on a ten-year-old product whose calculation pipeline had run unchanged for three years. Identified the opportunity and delivered it proactively, without a client request.
- The calculations lived in large, deeply nested SQL stored procedures that successive leads had worked around rather than touched. Moved them into the API layer behind a single source of truth and added Redis caching, using AI-assisted refactoring to make a change of that scope feasible for one developer. Lead a team of 3 on the product.

Health4Community (H4C) — Multi-Tenant Healthcare SaaS | Team Lead, current

.NET 10 (modular monolith, Clean Architecture / DDD) · Angular 20 · Azure AD B2C · Azure DevOps · SQL Server

Enterprise multi-tenant platform for healthcare and clinic organisations spanning HR and workforce management, process and compliance, and business administration.

- Re-architected the product off a legacy ASP.NET MVC codebase onto a modern stack and shipped the new version in 2 months, using AI-assisted development throughout.
- Own the multi-tenant foundations — fine-grained permissions, tenant isolation, Azure AD B2C identity and per-tenant branding — and the workforce suite: attendance, timesheets with multi-level approvals, leave, rostering, and configurable overtime and award loading.
- Designed the workforce modules around real operational edge cases — shift overlaps, approval chains, award-rule variations — rather than the happy path, so later requirements fit the model instead of forcing rework.

Groundwork — Context and Guardrail Layer for AI Coding Agents | 3rd prize, iFour internal hackathon 2026

Python 3.11 · Pydantic v2 · Typer (CLI) · networkx · Model Context Protocol (MCP) · TypeScript and .NET analysers

A deterministic context layer that lets AI coding agents make scoped, low-risk changes across large repositories instead of searching the whole codebase.

- Cut the context an agent loads per task from roughly 25,000 tokens to 800–1,000 — about 95% — verified with a side-by-side comparison test.
- Built a plan / assess / validate guardrail loop that computes each change's blast radius from a dependency graph and auto-escalates high-risk edits. Model-agnostic — any coding agent can consume it via its MCP server or CLI.

New Horizon ERP — Manufacturing Operations Angular 12 · .NET Core 2.1 · SQL Server

- ERP covering inventory, production, quality control, planning, finance and CRM. Developed and configured enhancements to the inventory and packaging modules to streamline operations.

Bistly — Forms, Surveys and Audience Analytics Platform Angular 12 · .NET Core 6 · SQL Server · Gemini API

- Integrated the Google Gemini API for automated sign-up and survey generation plus AI-driven response analysis, alongside configurable automation workflows and QR-code embedding.

CERTIFICATIONS AND RECOGNITION

- Microsoft Certified: Azure Fundamentals · Microsoft Certified: Azure Data Fundamentals
- iFour Technolab awards: Client Excellence (2025, PIQET delivery) · Rising Star (August 2024) · Employee of the Quarter (January 2023)
- 3rd prize, iFour Technolab internal hackathon 2026, for Groundwork · Hosted an Azure Fundamentals meetup at iFour Technolab

EDUCATION

B.E. Information Technology — Hasmukh Goswami College of Engineering | 2018 – 2022 | CGPA 7.67 / 10
